POSTTRAUMATIC STRESS RESPONSES IN INFANCY AND EARLY CHILDHOOD INTERVIEW (P.I.E.)
Ghosh Ippen, Strothers, Noroña, Velasco, Stepka, & Coffino 2011

This interview is adapted from the Diagnostic Interview Preschool Assessment (DIPA; Scheeringa, 2004) PTSD Module version 10/22/09. The full DIPA assesses for a range of diagnoses whereas this interview focuses solely on PTSD and common comorbid symptoms. The interview was designed to be flexible and easily tailored for research or clinical purposes. Goals guiding the adaptation include: 1) use colloquial language so that questions, as written, are more easily understood by caregivers with lower levels of education; 2) organize questions to enhance the flow of the interview (e.g. grouping sleep questions together); 3) gather data on symptoms included in the DSM V proposed revision as well as the DSM IV, DC: 0-3 and DC:0-3R, and 4) along with data on specific symptoms, gather information relevant to treatment (e.g. types of trauma reminders, caregiver response to child symptoms).

USE OF P.I.E.
The P.I.E. is currently in the pilot testing phase of its development. We are hoping some sites will be interested in working together to gather data to examine the measure's psychometric properties and clinical utility. Please feel free to use the P.I.E. for clinical purposes. At this point, use of the P.I.E. for research purposes must be granted in writing by the first author (chandra.ghosh@ucsf.edu) as she would like to be involved in studies examining the psychometrics of this instrument.

INSTRUCTIONS FOR INTERVIEWERS

ORGANIZATION
The interview has 9 sections. Eight sections measure different areas of child functioning (e.g. avoidance, mood and sleep). The 9th section assesses functional impairment. The interview can be administered in one sitting or by section over the course of multiple sessions depending on clinical needs.

At the end of the interview there is a scoring sheet and several response cards. The response cards can be used as visual prompts for questions that repeat throughout the interview (e.g. frequency and intensity).

LENGTH OF THE INTERVIEW
The interview may seem long. Here are reasons for the length
- There is space to write notes.
- There are follow-up questions (many of them optional) that allow interviewers to gather information on symptoms that are endorsed. If a symptom is not endorsed, the interviewer skips all the follow-up questions and goes to the next shaded question. Thus, it is only when many symptoms are endorsed that the interview takes a long time, but in these cases any interview should take a long time.
- The interview is written so that it is not only an assessment but a psychoeducation tool. As caregivers complete the interview, they are hopefully learning about their child's traumatic stress response. This is a key part of treatment and should help treatment progress more smoothly.
- The interview can be tailored to the needs of the interviewer/clinic and can be shortened (see the section on "tailoring the interview to your purposes")

ADMINISTRATION
- Each item has a main question, which is shaded. Ask the shaded question and code the response (see response categories below).
  - Responses not marked with "→" or "°" (e.g. NO NDA CR) require no follow-up. Skip to the next main question (the next shaded question).
  - For responses marked with "→" (e.g. YES→), ask the follow-up questions and code all "ICode" responses (an "ICode" response is one that the interviewer codes).
    - Follow-up questions include all questions up until the next shaded question.

- Follow-up questions are used to ensure that the child meets criteria for the symptom, to gather information on the frequency and severity of the symptom, and to gather clinical information relevant to treatment.
- If the response to the follow-up questions suggests the child does not have the symptom (e.g. caregiver misunderstood question), recode the response to the criteria item as NO instead of YES.
- If the response to follow-up questions suggests the level of symptomatology is within normal limits for the child's age, codes the response to the criteria item as AR (age-related) instead of YES.
  - When a response is marked with "o", the interviewer/agency can decide whether or not to ask the follow-up questions. The "o" stands for optional and allows for follow-up of symptoms that may be clinically relevant but not trauma-related. For example, a caregiver may endorse that a child has temper tantrums (item VII-5), but the interviewer determines the child is exhibiting temper tantrums at a level that is appropriate given the child's age. The response would be coded as AR ^{o} (Age-related). If the tantrums cause the caregiver distress, the interviewer may choose to gather data on the frequency and severity of the tantrums and the caregiver's response. Data gathered through follow-up to AR^o questions are not included in the total PTSD score.

RESPONSE CATEGORIES: Response categories are used to code responses to questions.

Response Category	Notes
YES	Child has symptom. For behaviors that may be normative given child's age; child has symptom at a level NOT within normal limits.
NO	Child does not have symptom
NO(due to accommodations)	Child does not have symptom but this is due to accommodations that others have made. When endorsed, this code is not included as part of the diagnostic score. A total accommodation score can be calculated and used as an outcome measure.
CR	Cannot Rate: Caregiver cannot rate symptom. This can happen for a variety of reasons: 1) caregiver does not know the child well enough or does not currently spend enough time with the child (e.g. new foster parent or parent who has been separated from child); 2) caregiver is unsure as to whether the child does the behavior; or 3) caregiver is unable to comprehend and rate a specific symptom (e.g. due to impairments in caregiver cognitive functioning).
AR & AR^o	Age Related: Child has symptom but at an age appropriate level. Some symptoms (e.g. sleep problems, temper tantrums) may cause caregiver distress even at age appropriate levels. In these cases, it may be helpful to track frequency and severity of the symptom as well as caregiver response. Age-related (AR) responses that may benefit from follow-up are marked with an "o". Individual clinicians and agencies can decide whether they would like to gather frequency and severity data on AR^o items.
NDA	NDA stands for "not developmentally appropriate". Code the response as NDA when the child does not have the capacity to exhibit the symptom because the child is too young. For example, a baby cannot talk or play about their experience because they do not have language or symbolic play capacities. The NDA code is used because often pretest the child does not have the capacity to exhibit a behavior but at posttest, the child has the capacity. In treatment-outcome research it is important to understand that certain symptoms may appear as the child develops the capacity to express the symptom.

INTERVIEWER CODES: Interviewer codes are used to direct the interviewer.

Response Codes	Notes
ICode	Interviewer Code: The interviewer codes the answer during the interview If the caregiver spontaneously provides the information (e.g. through the example), it is not necessary to ask the optional follow-up questions (e.g. probes provided under an RO section). If the caregiver does not spontaneously provide the information, the interviewer should probe until s/he can code the information or determine that s/he cannot rate this item (CR).
IScore	Interviewer Score: Interviewer scores the item based on responses to multiple items. Item can be scored during the interview or later at the interviewer's convenience. Scoring of these items can also be done by computer when the data are entered. For example, item 1.1-crit is based on the caregiver's response to the initial item ("Does child talk about what happened") and responses to follow-up questions (1.1-freq-p, I.1a, I.1b, I.1c, I.1d).

QUESTION CATEGORIES: Categories of questions that repeat throughout the interview

Abbreviation	Category	Coding	Description
crit	Criteria	See response categories	• Codes whether child meets criteria for symptom, meaning child has symptom at a level that is unusual for her/his age. • Sometimes the main question (shaded item) is detailed enough to permit coding of criteria, in which case it is labeled as "crit." • For other item, follow-up questions (e.g. example and rule-out questions) are needed to determine whether the child meets criteria. In these cases criteria is coded based on information obtained from the main question and follow-up questions.
ex	Example	Open ended response with optional coding for some items	• Respondent provides an example of the symptom. • Required for all items except those that are very behaviorally defined. • Used to verify that caregiver understood question (that caregiver and interviewer are referring to the same symptom) • Use to determine whether child's response is normative for age
RO	Rule-Out	See response categories	• Interviewer uses RO probes to determine whether other factors contribute to child's symptoms (e.g. age, medical problems). • If, the respondent spontaneously provides information to allow for RO coding (e.g. through the example) the interviewer can code the response without administering specific probes.
freq	Frequency	0=never 1=two times a month 2=1-2 times a week 3=2-3 times a week 4=almost every day	• Assesses frequency of the symptom within the past month • There is a visual response card that can be use to facilitate responses
sev	Severity	0=not at all distressing 1=minimally 2=moderately 3=markedly 4=extremely	• Assesses severity of the symptom, including how much distress or discomfort it causes the child, how intense or how strong the symptom is, and how much of a problem the caregiver sees the symptom as causing. • There is a visual response card that can be use to facilitate responses • For diagnostic interviews (determining presence or absence of PTSD), assessing for severity is optional. However, for treatment outcome research or clinical outcomes monitoring, severity ratings provide useful information.
acc	Accommodation	**Accommodation Level** 0 = none 1 = accommodates some, but not usually (<50% of the time) 2 = accommodates more than not (>50% of the time) 3 = almost always accommodates **Accommodation Quality** 0= accommodation seems helpful or presents no problem 1= accommodation seems mildly maladaptive 2= accommodation seems maladaptive	Degree to which others (e.g. caregivers) make changes in the environment, life, or their own behavior as a way of reducing child's symptoms. The code for accommodation level comes from the DIPA. We have added coding for the quality of the accommodation.

Abbreviation	Category	Coding	Description
cgresp	Caregiver response	+2: Significant strength +1: Moderate strength 0: Adequate, appropriate response -1 : Some clinical concern regarding caregiver response -2: Significant clinical concern regarding caregiver response	• Optional Code: Clinician impression • Tracks what the caregiver does when the child exhibits the symptom. • Cgresp scores may be useful for clinical work and clinical research. For example, it may allow us assessment of change in caregiver response to symptoms even when child's symptoms do not change (e.g. caregiver who is more soothing in response to trauma reminders).
ocgresp	Other Caregiver Response	+2: Significant strength +1: Moderate strength 0: Adequate, appropriate response -1 : Some clinical concern regarding caregiver response -2: Significant clinical concern regarding caregiver response	• Optional Code: Clinician impression • Code the response to symptoms of another caregiver who is involved in the child's life (e.g. mother's response might be rated under cgresp and father's response under ocgresp).
help	Help	0= Not a concern 1= concern but well managed 2= concern, would like help but not top priority 3= concern and moderate priority 4= concern, one of top priorities	• Optional code • Prioritize symptoms caregiver would like to focus on during treatment. • Can be used at posttreatment to determine whether the caregiver received help on those items prioritized at intake. • Rational for Help code vs. severity: In some cases the child's symptoms may not improve, but the caregiver may feel better supported and equipped to deal with the symptoms. In these cases the severity score may remain constant, but the help score might decrease and the cgresp score might increase.
cgexpect	Caregiver Expectations	A = accurate, within normal range H = high, given child's age L = lower than developmentally appropriate	• Optional code • Interviewer rating of whether caregiver's expectations for certain behaviors (e.g. feeding, sleeping, separation anxiety) are on track given the child's age and cultural context. • When expectations are not accurate, caregiver-focused interventions (e.g. developmental guidance of age appropriate norms, support of caregiver) may be an important part of treatment.
gate	Gating question	See response categories	• For some questions it is helpful to have a gating question before asking the criteria question.

TAILORING THE INTERVIEW TO YOUR PURPOSES

The interview was designed to be flexible and easily tailored for different clinical and research purposes. The interview allows for coding of DSM IV and proposed DSM V criteria for PTSD. In addition, questions were added to gather data on other symptoms that may be relevant to young children who have experienced trauma (e.g. comorbid symptoms and specific ways that young children may manifest symptoms). These questions are designated as optional questions. There are four kinds of optional codes. Codes for each and their meaning are detailed below. In the body of the interview, the codes appear in the far left hand column. An agency or clinician can tailor the interview to their purposes by deleting optional items prior to administering the interview.

Optional Codes	Notes
DC	• The item is related to DC:0-3 criteria for PTSD (either a DC:0-3 item or allowing for coding of a DC: 0-3 item) but is not part of DSM criteria (either DSM IV or proposed revisions for DSM V). • We strongly encourage people working with young children to keep these items. However, if you only want to code DSM criteria, DC questions can be skipped .
XP	The entire item is exploratory (meaning it is currently not needed to code DSM or DC:0-3R criteria for PTSD) and can be skipped (from XP to the double line) if the interviewer does not want the information for research or clinical purposes. These items are included because we believe they may provide valuable information about PTSD in early childhood.
OPT	The specific follow-up question is optional and not necessary for coding criteria. The question can be skipped if the interviewer does not want the information for research or clinical purposes. OPT questions generally gather clinical information that can be used for treatment planning. OPT items may also be used for research (e.g. to measure whether treatment results in changes in caregiver response – cgresp)
Baby	Some descriptions of how babies and toddlers may respond are included as part of the question, but when these descriptions are longer, they may be contained in a separate line marked "baby." These optional descriptions can be removed for clinics that are not seeing babies.

SCORING
Scoring can be done via computer. There is also a summary sheet at the end of the interview that can be used during the interview or at the end to look at scores for criteria items (C), frequency (F), and severity (S). Items that are included on the summary sheet are marked in the body of the interview with a double-lined box. The DSM V criteria that the item measures is shown either in the box or to the left of the box (e.g. B3).

ADMINISTERING THE INTERVIEW
Prior to administering this interview, you will need to do the following:
• Set a trauma frame with the caregiver and explain why you are asking about the child's history of exposure to potentially traumatic and stressful life events.
• Assess for the child's history of exposure to traumatic and stressful life events using a standardized screening instrument.
• If the child has had exposure to a potentially traumatic and stressful life events, administer the interview as follows. You can let the caregiver know that while the interview may take a long time, it will help guide treatment and it may help them to better understand their child.
• If you are assessing a baby, a child with no language, or a child with no symbolic play, you can read through the interview beforehand and quickly score all the items the child cannot do due to the age as NDA. This will make the interview go faster for caregivers of young children. For children who may have language or play, you should have first assessed their capacity in this area.

POSTTRAUMATIC STRESS RESPONSES IN INFANCY AND EARLY CHILDHOOD INTERVIEW (P.I.E.)
Ghosh Ippen, Strothers, Noroña, Velasco, Stepka, & Coffino 2011

INTRODUCTION
Your child has been through difficult experiences (*describe events you know child has experienced).* Things like this can affect children in many different ways. I'm going to ask you a number of questions, so we can understand whether your child was affected by what s/he went through, and, if s/he was affected, in what ways. For each problem or symptom we identify, I will ask you how often your child has had this symptom in the last month and how strong the symptom is, meaning how much distress or discomfort it causes. All this information will help us develop a plan to help her/him.

OPT: *(use if administering optional cgresp and help questions)* As we go through these different symptoms, we will also talk about how you usually respond when s/he does these things, and we will think about whether this is an area where you would like help or whether you feel comfortable with the way you currently deal with the particular problem or symptom. This will help us prioritize which areas to focus on in treatment.

	SECTION I – REEXPERIENCING, DISTRESSING RECOLLECTIONS (I.1-I.7) We are going to start by thinking about different ways that children may show us that they remember what happened.		
I.1	Does s/he talk about what happened? *(Code NDA if too young to talk)*		YES→ NO NDA CR
	I.1-ex: What does s/he say? Who does s/he talk to?		
	I.1-freq	How often did s/he talk about it in the past month? *Use frequency card*	Frequency: 0 1 2 3 4
	1.1-freq-p		**ICode:** Freq suggests intrusive:	*YES NO CR
	I.1a	Does s/he talk about it with people s/he doesn't know well or at unusual times or places?	**ICode:** Intrusive remembering:	*YES NO CR
	I.1b	When s/he talks about what happened, what feelings does s/he show? • Distressed/dysregulated affect: Really upset, scared, anxious, or angry? *YES NO • Flat affect: Shuts down or shows no emotions? *YES NO • Mood does not match what s/he's talking about? *YES NO *e.g. smiles while talking about something scary or sad.*	**ICode:** Disrupted affect B3 *(if any *YES, code as *YES)*	*YES NO CR
OPT	I.1c	Does the way s/he talks about it seem helpful or possibly healthy? *(Get example to verify)*	**ICode:** Healthy processing	YES *NO CR
OPT	I.1d	When s/he talks about it, given what happened, does her/his story make sense? Or, does it seem mixed up, odd, or hard to understand and <u>not just because of her/his age</u>.	Narrative coherence	YES IN PART NO
	1.1-crit	**IScore:** *If I.1=YES AND response to I.1-freq-p, I.1a, or I.1b, I.1c, or I.1d marked w/ * = YES*	**IScore:** (any circled *): B1	YES NO CR
	I.1-sev	How much of a problem is it? *Use Severity card*	Severity: 0 1 2 3 4

I.2	Does s/he play about what happened with toys, dolls, or action figures? *(e.g. Children who have been in a car accident may crash cars. Children who have seen people fight may have animals or dolls fight in play.)* *(Code NDA if child too young to play)*		YES→ NO NDA CR
	I.2-ex: What does she play about, where, with whom?		
	I.2-freq	How often did s/he play this way in the past month?	Frequency: 0 1 2 3 4
	1.2-freq-p		**ICode:** Freq suggests intrusive	*YES NO CR
	I.2a	Does s/he play this way with people s/he doesn't know well or at unusual times or places?	**ICode:** Intrusive remembering	*YES NO CR
	I.2b	When s/he plays about it, what feelings does s/he show? • Distressed/dysregulated affect: Really upset, scared, anxious, or angry? *YES NO • Flat affect: Shuts down or shows no emotions? *YES NO • Mood does not match what s/he's playing about? *YES NO *e.g. smiles while playing about something scary or sad.*	**ICode:** Disrupted affect B3 *(if any *YES, code as *YES)*	*YES NO CR
	I.2c	Does her/his play seem stuck? Like s/he keeps playing about what happened over and over and things don't change or get better?	**ICode:** Stuck play	*YES NO CR
OPT	I.2d	Does the way s/he plays about it seem helpful or even healthy? *(Get example to verify)*	**ICode:** Healthy play	YES *NO CR
OPT	I.2e	Does her/his play seem to tell a story that makes sense? *Note: In young children, incoherence not indicative of pathology, but coherence would be a strength.*	Narrative coherence	YES IN PART NO
	I.2-crit	**IScore:** If I.2=YES AND response to I.2-freq-p, I.2a, I.2b, or I.2c, or 1.2d marked w/ * = YES	**IScore:** (any circled *): B1	YES NO CR
	I.2-sev	How much of a problem? *Use Severity card*	Severity: 0 1 2 3 4	

XP	I.3 gate: Some children have imaginary friends, people they talk to who aren't really there. This is fairly common in early childhood. Does your child have any imaginary friends?		YES→ NO NDA CR *(if NO, NDA or CR go to I.4)*
	I.3-crit: Does the way s/he plays with or talks to or about imaginary friends seem to be related to what happened? B1		YES→ NO CR
	I.3-ex: What have you noticed?		
OPT	*(code themes, IF=imaginary friend)* [ ]Plays it out w/ IF [ ]Talks about it w/ IF [ ]IF protective [ ]IF harming child [ ]IF harming perpetrator		
	I.3-freq	How often in past month: 0 1 2 3 4	I.3-sev	How much of a problem: 0 1 2 3 4
	I.3a-crit	Does s/he ever get so involved with imaginary friends that s/he is not aware of what is happening around her/him? B3		YES→ NO CR
	I.3a-freq	How often in past month: 0 1 2 3 4	I.3a-sev	How much of a problem: 0 1 2 3 4

XP	I.4 Does s/he ever draw pictures of what happened or pictures that seem connected to what happened?		YES→ NO NDA CR

	I.4-ex: What does she draw, where, with whom?

	OPT	*(Code themes)*: [ ]Violent imagery [ ]Damage to self [ ]Monster [ ]Scary perpetrator [ ]Retribution to perpetrator

	I.4-freq	In the last month, how often did s/he draw about what happened?	Frequency: 0 1 2 3 4	
	I.4-freq-p		**ICode:** Freq suggests intrusive:	*YES NO CR
	I.4a	Does s/he do this with people s/he doesn't know well or at unusual times or places?	**ICode:** Suggests intrusive	*YES NO CR
	I.4b	When s/he draws about what happened, what feelings does s/he show? • Distressed/dysregulated affect: Really upset, scared, anxious, or angry? *YES NO • Flat affect: Shuts down or shows no emotions? *YES NO • Mood does not match what s/he's drawing about? * YES NO *e.g. Draws pictures of bad things happening, but is smiling or people in pictures are smiling.*	**ICode:** Disrupted affect B3 *(if any *YES, code as *YES)*	*YES NO CR
	I.4c	Does s/he ever keep drawing the same thing over and over?	**ICode:** Stuck drawing	*YES NO CR
	I.4-crit	**IScore:** *If I.4=YES AND I.4-freq-p, I.4a, I.4b, or 1.4c=*YES, criteria=YES*	**IScore:** (any circled *=yes): B1	YES NO CR
	I.4-sev	How much of a problem do you think this (her/his drawing about what happened) is?	Severity: 0 1 2 3 4	

I.5-crit: When s/he's not playing, does s/he acts out what happened or parts of what happened? B1	YES→ NO NDA CR

OPT	*e.g. Young children who have seen hitting or shooting may hit or pretend to shoot someone. Children who have seen someone get hurt, will sometimes talk about how they hurt in the same part of their body. Children who have experienced pain may complain of pain long after the actual injury and even after a doctor says they should not be feeling pain. Even older babies and toddlers may repeat noises or movements they have seen (e.g. falling down, throwing objects).*

	I.5-ex: What kinds of things have you noticed?

	I.5-frequency	How often in last month: 0 1 2 3 4	I.5-severity	How much of a problem: 0 1 2 3 4

OPT	*CLINICAL CODES FOR QUESTIONS I.1-I.5* When child does things that suggest that s/he remembers what happened, like talking, playing, drawing or acting out or what happened . . .

OPT	I.1-5-cgresp: What do you do? (-2 to 2)	I.1-5-ocgresp What does other caregiver do? (-2 to 2)	I.1-5-help Area where you want help? (0-4)

I.6-crit	Does s/he ever say that what happened is happening all over again even when it's not? Or, does s/he ever act like what happened is happening all over again, like s/he's reliving it?			B3	YES→ NO NDA CR
	(give example: e.g. a child who has been in a car crash might yell "the cars are crashing" or "look out we're going to crash" even when this is not happening. A child who's seen fighting may yell "stop fighting" even when no one around her/his is fighting or arguing)				
	I.6-ex: Can you tell me about a time when this happened?				
	I.6-freq	How often in last month: 0 1 2 3 4	I.6-severity *(rate high if I.7a or I.7b indicates dissociation):*		How much of a problem: 0 1 2 3 4
	I.7a	When this happens, does it ever seem like s/he spaces out or freezes so that she's not aware of what's going on around her/him? Like if you wave your hand in front of her/his face or touch her/him on the shoulder, s/he doesn't notice you.			*YES NO CR
	I.7b	Does it ever seem like s/he's hearing things that aren't there or seeing things that aren't there?			*YES NO CR
	I.7-crit	**IScore:** *If I.7a=YES OR I.7b=YES, criteria=YES*		**IScore:** (any circled *=yes)**:** B3	YES-> NO CR
	I.7-freq	How often in last month: 0 1 2 3 4	I.7-severity	How much of a problem *(Rate high if hallucinations)*: 0 1 2 3 4	
OPT	I.6-7-cgresp: What do you do? (-2 to 2):		I.6-7-ocgresp What does other caregiver do? (-2 to 2):	I.6-7-help Area where you want help? (0-4):	

SECTION II – AVOIDANCE (II.1-II.4): Remembering what happened can be emotionally painful. Sometimes children don't want to remember or think about what happened. Here are some things they may do.

II.1-crit: Does it ever seem like s/he doesn't remember what happened or has problems remembering parts of what happened? D1			YES→ NO NDA CR AR

	II.1-ex: What have you noticed?		

	II.1-RO	Does it make sense that s/he doesn't remember given how old s/he was when it happened, or does it seem like s/he's forgetting things s/he should remember?	**ICode:** Age-related	NO MAYBE YES* CR *If YES, code II.1-crit as AR*

	II.1-freq	How often in last month: 0 1 2 3 4	II.1-severity	How much of a problem : 0 1 2 3 4 *(note: differentiate between symptom severity and problems cause by child's not remembering or denying event (e.g. not being able to substantiate abuse)*

OPT	II.1-cgresp: What do you do? (-2 to 2):		II.1-ocgresp What does other caregiver do? (-2 to 2):	II.1-help Area where you want help? (0-4):

XP	II.2-crit: Does s/he ever say it didn't happen even when you know it did happen, and s/he's said that it happened before? C1	YES→ NO NDA CR

	OPT	II.2-ex: What have you noticed?

	II.2-freq	How often in last month: 0 1 2 3 4	II.2-severity	How much of a problem *(see note above)* : 0 1 2 3 4

II.3-crit: Does s/he ever say s/he doesn't like to think about what happened? C1		YES→ NO NDA CR

OPT	II.3-ex: What have you noticed?

	II.3-freq	How often in last month: 0 1 2 3 4	II.3-severity	How much of a problem *(see note above)* : 0 1 2 3 4

OPT	*CLINICAL CODES FOR QUESTIONS II.2 and II.3:* When child says it didn't happen or says she doesn't like thinking about what happened . . .

OPT	II.2-3-cgresp: What do you do? (-2 to 2):	II.2-3-ocgresp What does other caregiver do? (-2 to 2):	II.2-3-help Area where you want help? (0-4):

II.4-crit: Does s/he ever say s/he does not want to talk about what happened? Or, when others talk about it, does it seem like s/he wants them to stop? C3		YES→ NO NDA CR

OPT	*e.g. starts talking about something else, becomes noisy or starts to behave badly, shuts down, starts doing something else so s/he doesn't have to pay attention to what you are talking about, leaves the room, or tries to get people to stop talking about it in any other way.*

	II.4-freq	How often in last month: 0 1 2 3 4	II.4-severity	How much of a problem *(see note below)* : 0 1 2 3 4

OPT	II.4-cgresp: What do you do? (-2 to 2):	II.4-ocgresp What does other caregiver do? (-2 to 2):	II.4-help Area where you want help? (0-4):

SECTION III. REMINDERS AND REACTIONS TO REMINDERS
Many things may remind your child of what happened: activities, places, people, sounds, smells, times of the year, things in the environment, weather. We call these things reminders. Some children try to avoid reminders. Others may show a change in their feelings and behavior when they're around them.

Instructions: Ask III.1-crit OR optional items *(III.P.1, III.A.1, III.T.1, & III.O.1)*. *Optional items gather clinical information about specific reminders.*		

OPT	We're going to start by identifying things that may remind your child of what happened and then think about how they affect your child.	
OPT	III.P: Let's start with places. Are there places that might remind her/him of what happened? *Probe as necessary, offering examples that might be relevant given child's experience.*	Places as reminders YES→ NO CR
	OPT III.P-ex : *(places identified)*	
	OPT III.P.1 Does it ever seem like s/he doesn't want to go to these places? S/he might refuse to go, complain, shut down, or have a tantrum when you're going to these places.	Avoidance of places YES* NO CR NDA*(too young to avoid)*
OPT	III.A: Are there activities or things your child did or does that might remind her/him of what happened? Activities can include outings like going to the beach or playing soccer or every day things like eating, taking a bath, singing certain songs. *Probe as necessary. Give examples of relevant trauma and loss reminders.*	Activities as reminders YES→ NO CR
	OPT III.A-ex: *(activities identified)*	
	OPT III.A.1 Does it ever seem like s/he doesn't want to do these things any more? S/he might refuse to do them, complain, shuts down, or have a tantrum when you're going to do them.	Avoidance of activities YES* NO CR NDA*(too young to avoid)*
OPT	III.T: Are there specific times of the year, seasons, holidays, or anniversaries that might remind her/him of what happened? *Give examples of relevant trauma and loss reminders and help caregiver think about anniversary reactions.*	Times of year as reminders YES→ NO NDA CR
	OPT II.T-ex: *(times identified)*	
	OPT III.T.1 Does s/he ever say things like s/he doesn't like that time of the year or seem to shut down or not want to celebrate certain holidays s/he used to like? *Optional: Even when they seem too young to remember, children may be sensitive to anniversaries of the event. For example, a child whose trauma occurred during the rainy season may begin remembering what happened when it starts to rain. Have you noticed any anniversary reactions?*	Avoidance of time of year YES* NO CR NDA*(too young to avoid)* [ ] check here if no anniversary yet

OPT	**III.O:** Are there other things that might remind her/him of what happened, including objects, sights, smells, sounds, things in the environment, weather? *Probe as necessary. Give relevant examples of trauma and loss reminders.*		Other reminders YES→ NO CR

CRITERION B: REEXPERIENCING				
Item	Description	C	F	S
I.1-crit	talk about event			
1.2-crit	play about event			
1.3-crit –XP	plays/talks to imaginary friends about it			
1.4-crit -XP	draw pictures of event			
1.5-crit	acts out event outside of play			
(B1) Distressing memories of event+				
IV.2a-crit	nightmares or bad dreams about event			
IV.2b-crit:	general increase in nightmares			
(B2) Recurrent distressing dreams+				
1.3a-crit -XP	trauma-related play w/ imaginary friends & not aware of surroundings			
1.6-crit	says happening all over again, reliving			
1.7-crit	when reliving, freezes, spaces out, hears or sees things that aren't there			
III.6-crit	Around reminders – spacey/unaware			
VI.2a or VI.2b	spacey and distracted and not aware of what is happening or freezes			
(B3) Dissociative reactions, flashbacks				
III.3-crit	change in behavior around reminders			
III.4-crit	change in emotions around reminders			
I.1b	e.g. disrupted affect: talking about it			
I.2b	e.g. disrupted affect: playing about it			
I.4b-XP	e.g. disrupted affect: drawing it			
(B4) Psychological distress at reminders				
III.5-crit	physical signs stress around reminders			
(B5) Physiological reactions to reminders				
Total (B1-B5)		Total-freq		Total-sev
DSM Criterion B met? (Any one item B1-B5=Yes)		**YES**		**NO**

CRITERION C: AVOIDANCE				
Item	Description	C	F	S
II.2-crit –XP	denies it happened			
II.3-crit	says doesn't like to think about event			
(C1) Avoiding thoughts or feelings				
II.1-crit	avoids activities, places, times. . .			
(C2) Avoiding activities, places, times, reminders				
II.4-crit	avoids conversations			
III.2-crit	avoids people and things people do that remind of event			
(C3) Avoid people, conversations, or interpersonal situations				
Total (C1-C3)		Total-freq		Total-sev
DSM Criterion C met? (Any one item C1-C3=Yes)		**YES**		**NO**

EXPLORATORY ITEMS RELATED TO DC:0-3 (DC)				
Item	Description	C	F	S
IV.3-crit	night terrors			
IV.5-crit	unusual behaviors around food			
IV.6-crit	changes/unusual toileting habits			
IV.7-crit	language problems			
IV.8-crit	concerns about motor skills			
V.9-crit	new fears or worries			
VII.11-crit	unusual sexual behaviors			
VIII.6-crit	more clingy, problems separating			
EXPLORATORY ITEMS NOT FALLING UNDER CRITERIA (XP)				
Item	Description	C	F	S
IV.4-crit	amount of food s/he eats			
IV.9-crit	sensory sensitivity			
IV.10-crit	ability to play			
IV.11-crit	medical or physical health problems			
IV.12-crit	act younger than they actually are			
IV.13-crit	act older than they actually are			
V.4-crit	more difficulty calming down			
VII.4-crit	more active			
VIII.5-crit	focused on punishing/revenge			
VIII.7-crit	afraid of strangers			
VIII.8-crit	over friendly with strangers			

	VIII.9-crit	not accept support/comfort from adults			

CRITERION D: COGNITIONS AND MOOD				
Item	Description	C	F	S
II.1-crit	problems remembering			
D1) Problems remembering				
V.6-crit	negative view of self			
VIII.3-crit	negative view of other people or world			
(D2) negative expectations self, others, world				
V.7-crit	blames self			
VIII.4-crit	blames others			
(D3) Distorted blame self/others about event				
V.3-crit	show negative feelings more strongly			
V.5-crit	more sad or down			
V.10-crit	has negative feelings most of time			
(D4) Pervasive negative affect				
VII.1-crit	plays less			
VII.2-crit	does other activities less			
(D5) Diminished interest in activities				
VII.2-crit	seems distant			
(D6) Feeling of detachment				
V.1-crit	smiles or laughs less than before			
V.2-crit	doesn't show negative feelings			
VIII.1-crit	less affectionate or loving			
(D7) Inability experience positive, loving emotions				
Total (D1-D7)		Total-freq		Total-sev
DSM Criterion D met? (Two items D1-D7=Yes)		**YES**		**NO**

CRITERION E: AROUSAL/REACTIVITY				
Item	Description	C	F	S
VII.8-crit	tantrums more			
VII.9-crit	more aggressive			
(E1) Irritable, angry, or aggressive behavior				
VII.5-crit	reckless or dangerous behavior			
VII.6-crit-XP	more accidents, hurt more often			
VII.7-crit	threatens or actually harms self			
(E2) Reckless or self-destructive behavior				
V.8-crit	fearful or worried bad things will happen to self or others.			
VI.3-crit	"on the alert," watching out for danger			
(E3) Hypervigilance				
VII.3-crit	jumpy, easily scared or startled			
(E4) Exaggerated startle				
VI.1-crit	problems concentrating focusing			
VI.2-crit	spacey or distracted			
(E5) Problems with concentration				
IV.1a-crit	hard time going to sleep			
IV.1b-crit	trouble staying asleep at night			
(E6) Sleep disturbance				
Total (E1-E6)		Total-freq		Total-sev
DSM Criterion E met (Two items E1-E6=Yes) **YES NO**				

Functional Impairment				
Item	Description	C	F	S
IX.1-crit	caregiver-child relationship problem			
IX.2-crit	other caregiver relationship problem			
IX.3-crit	sibling problem			
IX.4-crit	care providers/teacher problem			
IX.5-crit	learning problem			
IX.6-crit	peer problem			
IX.7-crit	hard to take child out in community			

Instructions
Note: Can also be computer scored
C=criteria – check whether item meets criteria (marked with YES→)
F=Put frequency (optional)
S=Severity (optional)
Total (total number of symptoms meeting criteria)
Total-freq (total frequency added up)
Total-sev (total severity added up)
